Awaaz

Awaaz — PRD addendum v2

Talk and hear profiles, presets, call paths, caller ID, the WhatsApp bot and the updated scope for 31 October.

23 October 2026. Supersedes PRD v0.1 where they differ.

Contents

1. Talk and hear are separate, configurable choices

2. Call paths

3. WhatsApp bot (P0)

4. Updated scope for 31 October

5. Additional success metrics

23 October 2026. Adds the decisions made after PRD v0.1 and the v2 UI prototype. Where this addendum and `PRD.md` differ, this addendum wins.

---

1. Talk and hear are separate, configurable choices

Every user sets **how I talk** and **how I hear** independently, picks a starting preset, and can override per contact and switch during a call.

How I talk

Option	Who it serves	Phase
My own voice	Deaf people who speak; hard-of-hearing users	P0 (in-app audio)
Type, Awaaz speaks (cloned or stock voice)	People who can't speak; deaf people who prefer typing	P0
Phrases and smart replies	Everyone typing	P0
Help me say it (a few words → one polite sentence, approved before speaking)	Slow typists, low literacy, anxiety	P0
Speak clearly for me (user speaks; Awaaz re-says it clearly)	Unclear speech after stroke, deaf speech, dysarthria	P1
Sign language via human interpreter	ISL users	P2 (partner)

How I hear

Option	Phase
Live captions with highlighted numbers, dates, prices	P0
Normal audio (speech-boosted, in-app)	P0
Translate for me (read and type in my language)	P0
Spoken summary after the call	P0
Clear voice (each sentence repeated slower and louder, only to me)	P0 in-app, P1 on a phone leg
Vibration cues (they started / stopped talking)	P1

Presets

Preset	Talk (default first)	Hear
I can't speak	Type, phrases, help me say	Normal audio, summary
Deaf, I can speak	My voice, help me say, type	Captions, vibration, summary
Deaf, I prefer typing	Type, phrases, help me say	Captions, vibration, translate
Hard of hearing	My voice	Clear voice, normal audio, summary
My speech is unclear	Speak clearly, my voice, phrases	Normal audio, summary

Preset	Talk (default first)	Hear
I don’t read much	My voice, phrases	Clear voice, summary

2. Call paths

Situation	Path	Caller sees	Phase
User calls any number	Awaaz line (cloud call)	Awaaz number	P0
Someone calls the user’s Awaaz number	Rings the app; message taking	—	P1
Normal calls on the user’s SIM	Awaaz joins as a third line and merges (native Android default phone app; manual on iPhone)	User’s own number	P2
Missed SIM calls	Carrier forwarding to the Awaaz number → captioned message	—	P1
WhatsApp chats and voice notes	Awaaz bot	—	P0
WhatsApp calls with Awaaz	WhatsApp Business Calling API; “call me via Awaaz” links	—	P2
Personal WhatsApp calls between friends	Not accessible to any app; use the Awaaz link, face to face mode on a second device, or built-in phone captions	—	Not possible
In person	Face to face split screen	—	P1
Phone menus	Keypad with spoken options listed; Call for me	—	P0
Video calls	Desktop captions from tab audio	—	P2
Emergency	SOS card + family alert; no automated 112	—	P1

Caller ID: Awaaz never displays the user’s personal number on calls it places. Indian rules prohibit CLI spoofing. Keeping the user’s own number is only possible through the merge path.

Call audio access: apps cannot read normal phone call audio on Android or iOS. The merge path works because Awaaz is a separate participant on the call.

3. WhatsApp bot (P0)

- Start calls and tasks by text or voice note (“Sharma Medical ko call karo, Telma 40 chahiye”).
- Approve task decisions with buttons.
- Receive call summaries and task results, including voice notes.
- Forward any voice note to get it as text.
- Type a reply and get a voice note in the user’s own voice to forward.
- P1: live relay inside the chat (captions as messages, replies by text).

4. Updated scope for 31 October

P0: Awaaz line outbound with Type, Phrases/Smart replies, Help me say and My voice; captions, normal audio, translate, clear voice (in-app), summaries; profiles and presets; Call for me (gas, medicine); scam shield; WhatsApp bot (tasks, approvals, summaries, voice notes).

P1: Speak clearly for me, voice cloning, incoming calls on personal numbers, missed-call forwarding, live relay in WhatsApp chat, face to face, vibration cues, SOS.

P2: Android merge app, WhatsApp calling, sign language interpreter partners, desktop captions, accessible business lines.

5. Additional success metrics

- Share of calls using each talk mode and hear mode (validates the configurable design).
- Mid-call mode switches per call.
- WhatsApp-only users vs app users.
- Voice notes transcribed and voice-note replies sent per week.
